

Computers have made history, and they are still continuing to make history. As time goes by, new computers are being invented and created in different and better ways. Most people ask the same question, “When was the first computer invented?” Unfortunately, this question has no easy answer because of all the different types of classifications and types of computers. The z1 was originally created by Germany’s Zuse in his parents’ living room, 1936 to 1938. It is considered to be the first electrical binary programmable computer. In other words, this means that the first computer was officially invented between the years 1936 and 1938. Obviously, computers have made history and helped people get different types of information. We get information about computers’ history from the computer. Computers have a great value for people’s education and history.
